/home/store/summary

Gui Reis

```
1  store = {
2    "img_url"
3    "title"
4    "description"
5    "review" {
6      "rate"
7      "amout"
8    }
9    "favorite": bool?
10   "coordinates"= {
11     "address"
12     "long"
13     "lat"
14     "distance"
15     "time"
16     "price"
17   }
18 }
19
20 pagination = {
21   current = 1
22   total_pages = 30
23 }
```

Architecture interview - Store List

Question

Design the first screen within a new app that will present a list of stores to the client.

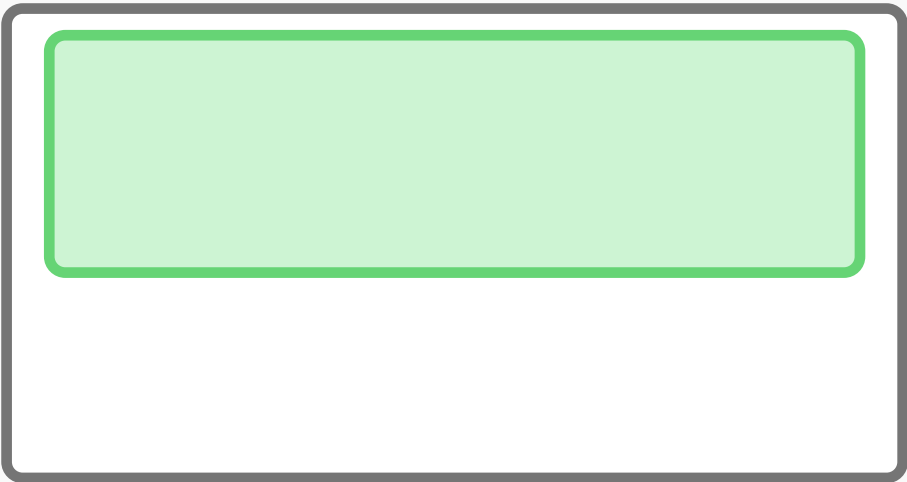

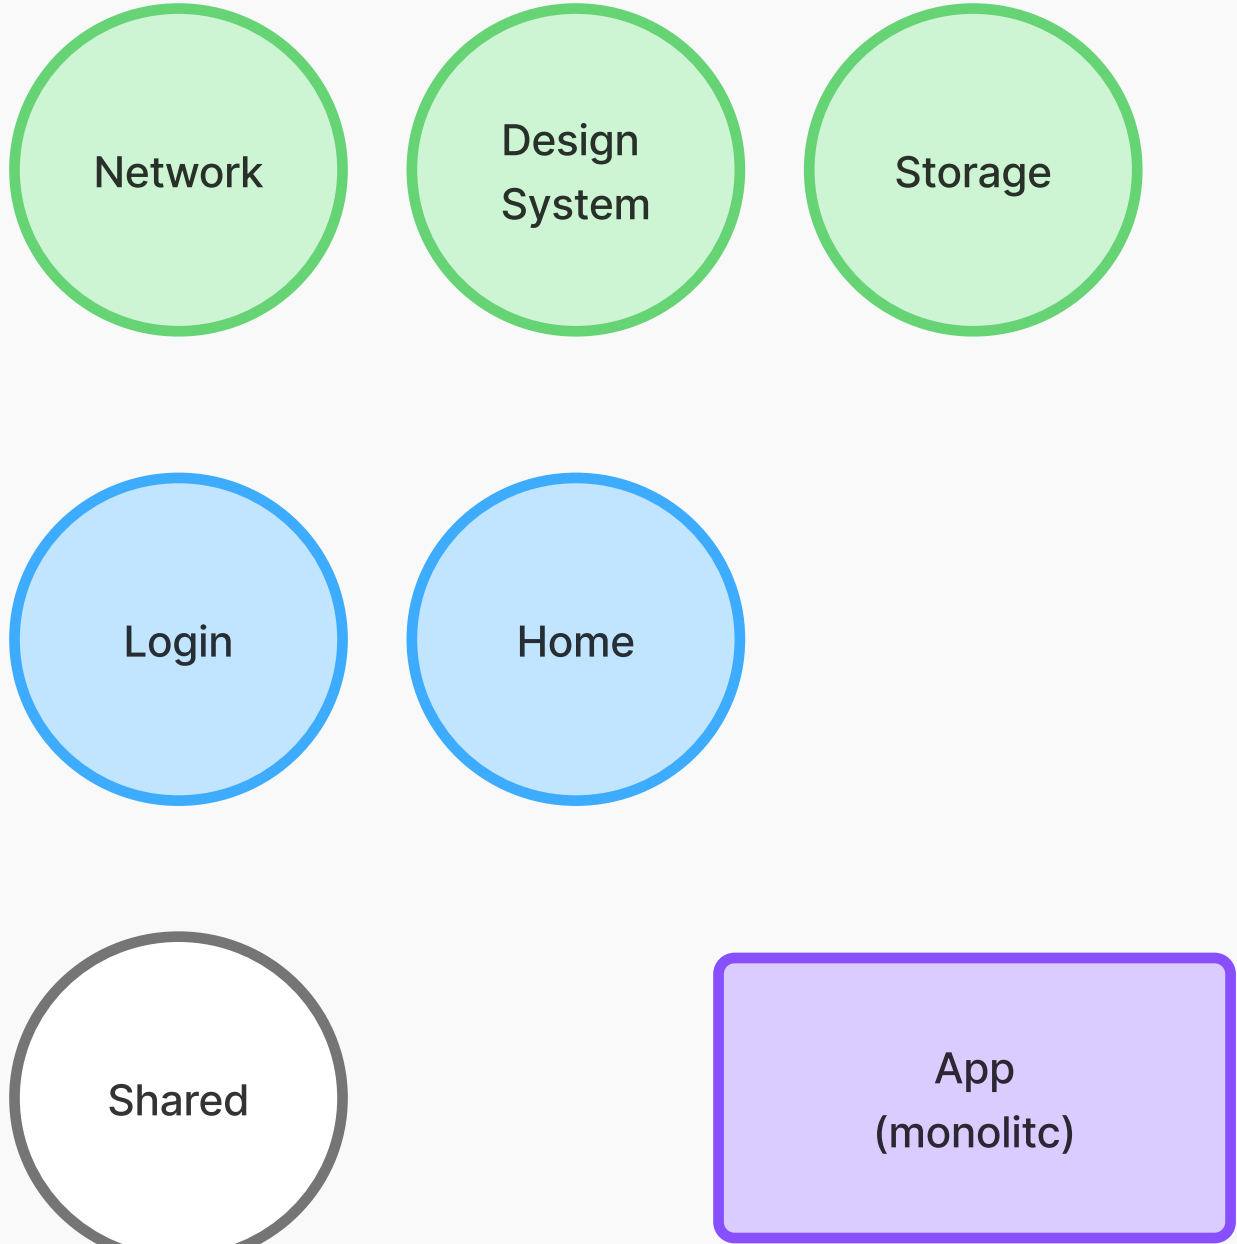

This screen represents the homepage of the app as a store list. Please take note of the Favorites feature represented by the heart in the diagram.

We should be designing a full working system that will eventually scale to support multiple teams of engineers - starting with the API contract coming from the backend, through the app's networking capabilities, presentation design and everything in between.

This will be the first feature within a new app - so reusability and testability is needed and should be discussed.

Improvements and enhancements are welcome.

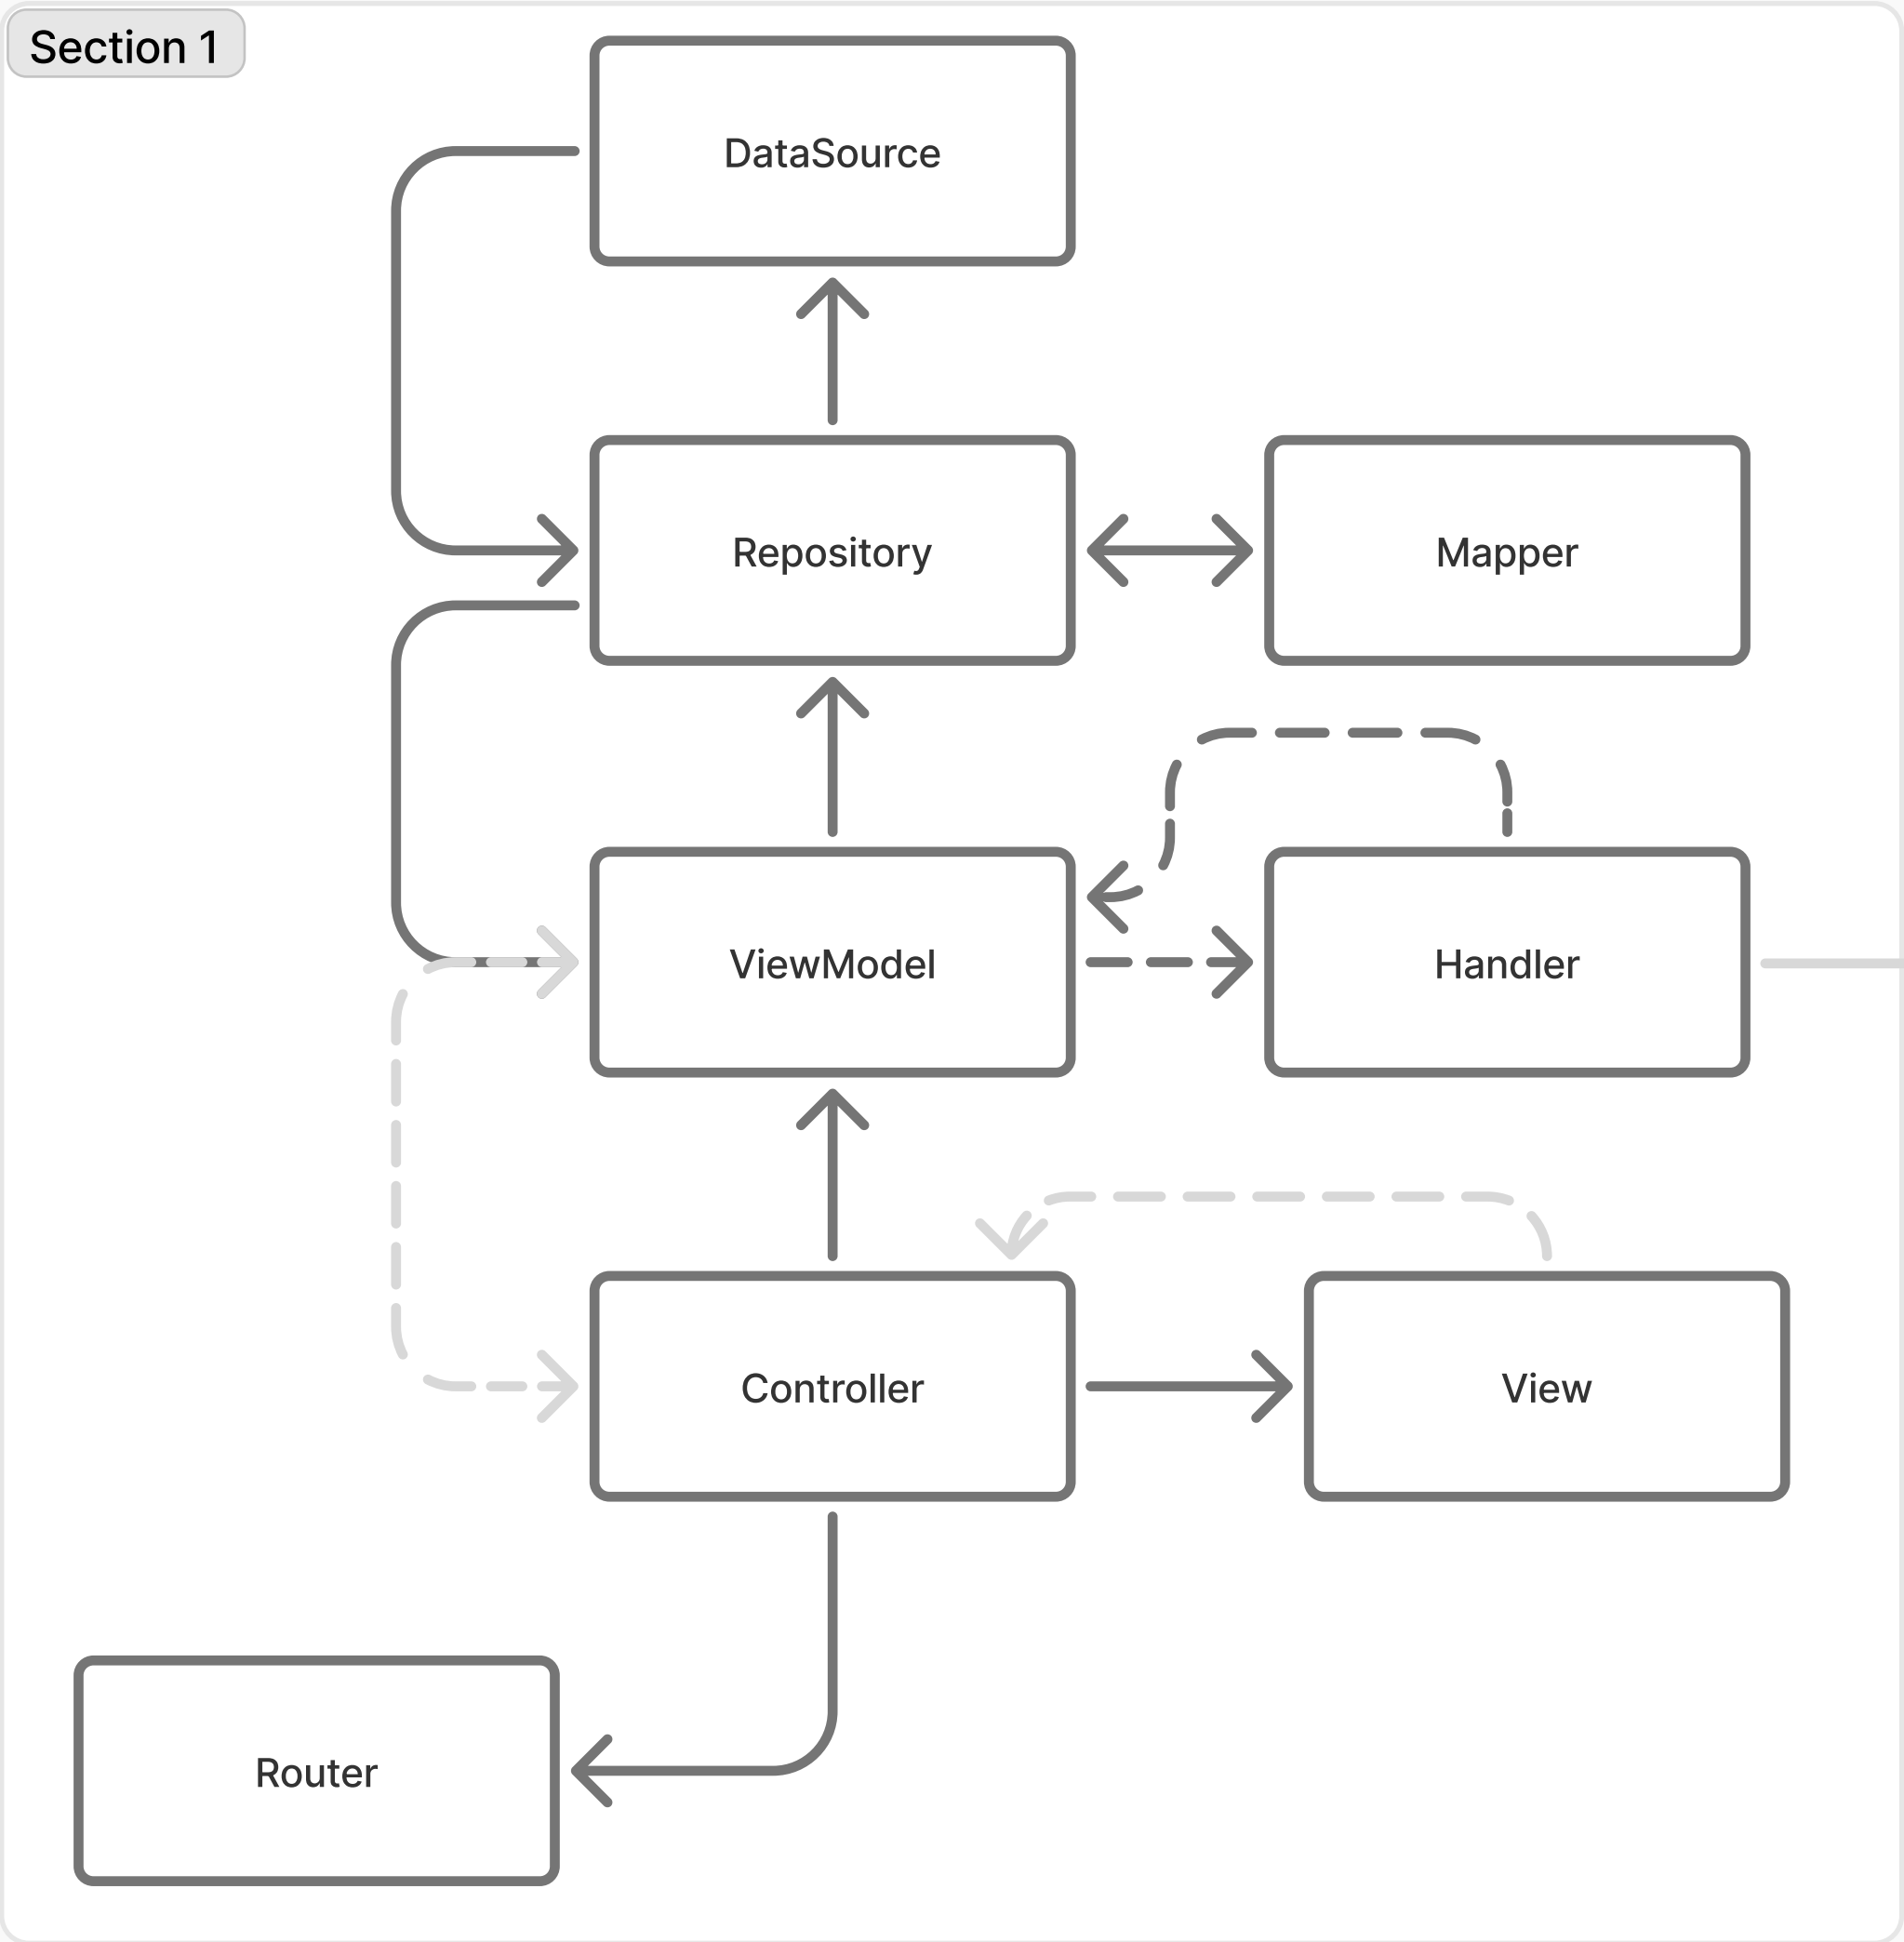

Here is a sample sketch of the UI we are aiming for:

- uikit
- delegate
